

Ngabirano Daniel

In my formative years, I grappled with absent-mindedness, always envisioning plans for the future, reimagining scenarios, and creatively designing things. This imaginative inclination fueled my practical side, driving me to construct and engage with tangible concepts and predictable outcomes. I drew a distinct line between science and magic, seeking to comprehend the reasons behind phenomena.

Fascinated by skills that transform imaginative concepts into reality “wood and metalwork, molding, programming, and electronics” I pursued them relentlessly. The choice to be a builder rather than a mere user motivated me, as I believed it would sustain my enthusiasm. Consequently, I invested time in acquiring these skills, though some, like electronics and metalwork, were initially challenging.

Mastering physics, math, chemistry, and technical drawing proved crucial for honing these skills. As time passed, my interests expanded to include music, biology, space, and inventions. Ironically, the notion of turning these skills into a source of income didn't occur to me until I delved into programming.

My early academic journey showcased my quick learning ability, progressing from nursery to primary within a term. Secondary education introduced me to a diverse array of over 17 subjects, later streamlined to 10 and then 5. These subjects spanned sciences, arts, and languages, encompassing my high school experience over six years.

University brought a focused pursuit of programming, driven by a newfound interest in leveraging its advantages for financial gain. Presently, I'm confident in my ability to develop desktop and web applications. However, realizing the full

potential of this skill requires further investment in data manipulation and analysis.

While I may not appear overtly interested or assertive, I prove invaluable in the end. My reserved nature contrasts with my inclination towards helpfulness, although public speaking remains a challenge.

Socially, I appreciate those with a good sense of humor. My serious demeanor often conceals my "attention/deep thinking" face, occasionally mistaken for seriousness or anger. I'm generally quiet and contained, a departure from my primary school days when I led a group of boys around the hills, only to have my exuberance curtailed by a knee injury.

In the realm of projects, I display flexibility. Self-imposed tasks find me more laid-back, while imposed and group projects bring out my diligent side. I occasionally prioritize others' needs over mine and adapt responses to new situations.

During secondary school, I took on roles as a club coordinator (woodwork club) and a class monitor for two consecutive years. Managing diverse personalities taught me the impossibility of pleasing everyone. These experiences, though fleeting, ranged from members refusing to clean unless explicitly directed to intentional trapping of a teacher in an illustration. These incidents made me politically indifferent, observing that in the end, politics often unravels as planned betrayal of the elected.

My biggest influence is from my dad, the fact that he can be a simple electrician, farmer to a teacher indicated that I can specialize in more than one field of study. On the other hand, my mum would teach me about bible proverbs and parables but the one of two sons. It taught me that patience is key, endeavor to accomplish tasks and someone is looking out for you. Having older sisters, taught to not always go with the flow, no one is always right and asses before following a notion.

As a young African, I was fixated on being an investor because what could be better than money making money, looked like a perpetual money source. It's still looks like but as a grownup is more into creating life changing accomplishments.
